| Table 1. | X-Band Radio Source Catalog: DDOR_2011 | 10 |

1 *Introduction*

1.1 *Purpose*

This module provides a catalog of the angular positions of astronomical radio sources that establish the celestial reference frame used for interplanetary spacecraft navigation using Delta–Differential One–way Ranging (Δ DOR). The catalog may also be useful for other applications requiring the precise location of radio sources such as antenna pointing calibration.

1.2 *Scope*

The discussion in this module is limited to describing the contents of the source catalog and providing a listing of the catalog – both within the module and as a link to a computer–readable versions. The equipment used to collect the data from which the catalog is derived is discussed in module 211 of this handbook. The capabilities of the DSN for performing Δ DOR are contained in module 210.

2 *General Information*

The angular positions of a set of extragalactic radio sources serve as fiducial points for Δ DOR observations performed by the DSN. This set of point positions is commonly referred to as a *catalog*. The catalog described in this module comprises 3652 sources that have been observed in a frequency range that includes the X–band deep space allocation (International Telecommunications Union Category B) of 8,400 – 8,450 MHz. A distribution of the radio sources in the catalog is illustrated by Figure 1.

2.1 *Catalog Development*

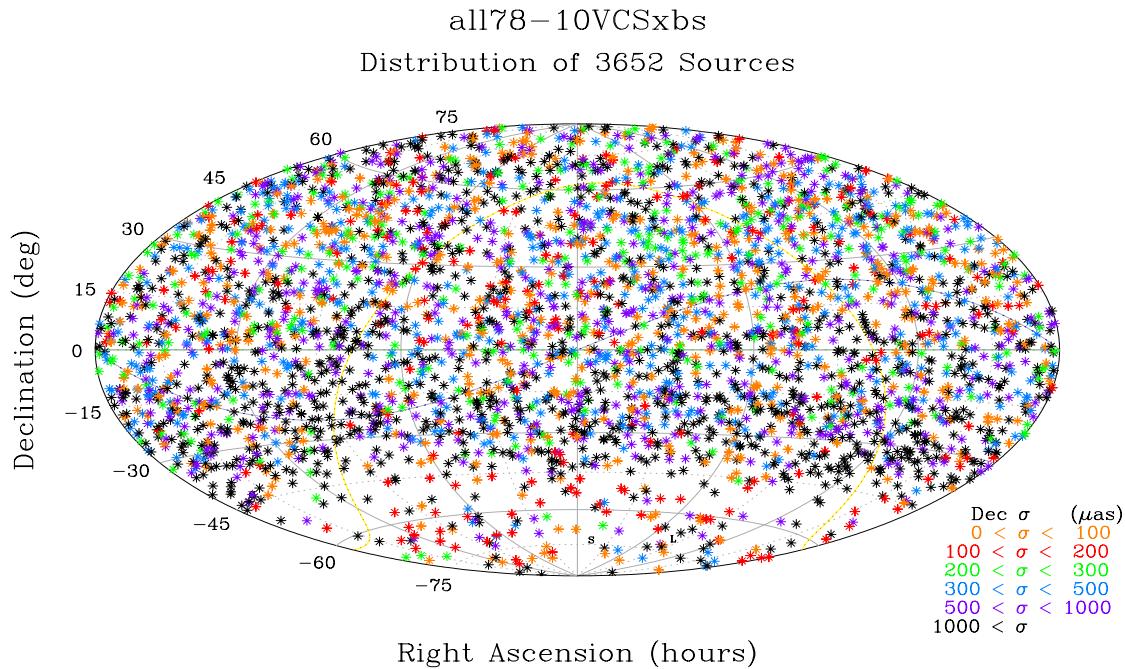

The data used to develop the source catalog included delay and delay rate observables obtained from S–band and X–band Very Long Baseline Interferometry (VLBI) data acquired with the DSN VLBI Subsystem and also included data acquired from other organizations observing at the same frequencies. The angular positions of the radio sources are estimated by a monolithic least–squares fit to these VLBI observables. A total of 6 million delay and delay rate observations, collected between October 28, 1978 and November 24, 2010, were used to estimate the final source positions. Details of the physical modeling required by this procedure are given in [1].

Estimated parameters included radio source positions, station locations, station clocks, wet troposphere delays, and troposphere gradients. A “no net rotation” constraint was placed on the radio source positions relative to International Celestial Reference Frame 2 (ICRF2) using a subset of 295 defining sources. Kinematic station positions were estimated daily for each site relative to International Terrestrial Reference Frame 08 (ITRF08) a priori values and rates [2]. Station clocks were estimated using a linear model for the offset and rate parameters. Wet zenith troposphere delays were estimated at intervals ranging from 20 minutes to one hour based on the

Vienna Mapping Function 1 (VMF1) mapping function [3]. Troposphere gradients were estimated approximately once per day relative to a priori values with 100 mm uncertainties using the following formula from Steigenberger [4]:

$$G_{NS}(\text{mm}) = -0.5 \sin(2\phi)$$

where G_{NS} is the troposphere gradient in the North–South direction and ϕ is the antenna geodetic latitude. The Kalman Earth Orientation Function (KEOF) COMB2009 Universal Time and Polar Motion (UTPM) solution [5] was used to fix Earth orientation and polar motion (EOP) values. Earth precession and nutation models are taken from MHB2000 [6]. Constant offsets for the PSIA, EPSA nutation model parameters [1] were estimated in order to avoid overweighting the solution with respect to ICRF2.

(Colors indicate the formal error in the source declination coordinate.)

Figure 1. Distribution of radio sources in right ascension and declination

Limiting comparison to 295 ICRF2 defining sources yields rotational alignment at the 0.1–2.6 μas level in all components and Weighted Root Mean Square (WRMS) differences of 48 μas in

the quantity right ascension (RA) cos(dec) and 83 μ as in DEC. Broadening the comparison to include all common sources yields rotational alignment at the 1.2–3.8 microarcsecond (μ as) level and WRMS differences of 94 μ as in RA cos(dec) and 128 μ as in declination (DEC). Source positions were extracted from the all78–10VCSxbs.srf file using the “catout” utility and the file all78–10VCSxbs.cat_iers was provided for submission to JPL’s Service Preparation Subsystem (SPS).

2.2 Catalog Format

The catalog uses the J2000 reference frame and is rotationally aligned with ICRF2 [7, 8] at the 1–3 μ as level in all components. In addition to the presentation in Table 1, the catalog is available for download as a fixed-width file at:

<http://eis.jpl.nasa.gov/deepspace/dsndocs/810-005/107/catalog-fixed.txt>

Lines of the fixed-width file are terminated with ASCII Character 10 (Unix convention). The fixed-width file may be read with the following FORTRAN format statement,

FORMAT (1X, A8, 1X, A12, 1X, I4, 1X, 2(1X,I2), 2X, F11.8, 1X, A1, I2, 1X, I2, 1X, F10.7, F11.8, F10.7, F8.4, 2F8.1, I6, 2F6.2, F5.1).

2.2.1 B1950 Name (characters 2 through 9)

This is the source name based on its position at the Besselian epoch B1950.0 which is one of the two standard epochs that have been used in the last 30 years for reporting source positions (the other being the Julian epoch J2000.0). The name is related to the position of the source but is most useful for searching historical databases for information about the source. The name is constructed as follows. The first two digits represent hours of right RA, the next two digits minutes of RA, the fifth place is used to specify the sign of the declination, places 6–7 give degrees of declination, and the last digit gives the first digit of the fractional part of degrees of declination. Thus the first entry in the catalog, 2357-326, is interpreted as a right ascension of twenty-three hours and 57 (time) minutes and a declination of negative 32.6 degrees at the B1950.0 epoch.

2.2.2 Common Name (characters 11 through 22)

This is the name most commonly used in the literature for the source and is also the name used by the DSN for Delta-DOR measurement scheduling. Often, there is a short prefix that indicates the organization or radio observatory that first documented the source in a survey. The remainder of the name may be related to the source position or an arbitrary sequence number. Some of the prefixes and naming conventions include [9]:

- 3C *nnn* – From the Third Cambridge Catalog. The *nnn* is the numerical designation assigned by the catalog. This survey, originally conducted at 159 MHz, identified many of the stronger sources used in VLBI. Unfortunately, many of these stronger sources are also less point-like making them less desirable for the highest accuracy astrometric measurements.
- 4C *zz.nn* – From the Fourth Cambridge Catalog. The *zz* corresponds to the declination “zone.” The *nn* is a sequential number within the zone. There are no sequential numbers greater than 99.

- B2 $RRrrSDDa$ – Most likely from the Second Bologna Survey. The $RRrr$ is hours and minutes of right ascension, S is the sign of declination and DD is degrees of declination. The meaning of a (an alpha character) is unknown.
- CTA nn and CTD nn – From the California Institute of Technology “A” or “D” surveys where nn is the numerical designation assigned by the catalog.
- DW $RRrrSDDd$ – From the Dwingelo Radio Observatory (Netherlands) catalog. The $RRrr$ is hours and minutes of right ascension, S is the sign of declination, DD is degrees of declination, and d (if present) is the first digit of the fractional part of declination.
- GC $RRrrSDDd$ – Most likely names taken from the “General Catalog of 33342 (optical) Stars.” The $RRrrSDDd$ are as described before.
- HR $nnnn$ – Most likely names taken from the “Harvard Revised (optical) Catalog” where nnn is the numerical designation assigned by the catalog.
- M nn – Most likely names taken from the “Messier Catalog of Galaxies” where nn is the numerical designation assigned by the catalog.
- NRAO nnn – From the National Radio Observatory catalog where nnn is the numerical designation assigned by the catalog.
- O_ nnn – From the Ohio State Survey where the second letter indicates the hour of right ascension (two letters are skipped from the alphabet) and nnn is a numerical designation assigned by the catalog.
- P $RRrrSDDd$ – From the Parkes Radio Observatory (southern Australia) survey. The $RRrrSDDd$ are as described before.
- VRO $DD.RR.rr$ – From the Vermillion River Observatory (University of Illinois) catalog. The DD is degrees declination and RR is hours right ascension. The rr is unknown but may be either minutes or fractional hours of right ascension.

2.2.3 ID Number (*characters 24 through 27*)

A unique number, presently in the range of 1 to 4044, is assigned to each radio source for use by programs that identify sources by number instead of name. The correspondence between source name and number will not change when the catalog is updated. This catalog can be used to establish a unique correspondence between the B1950 or Common Name and ID number. If a source in this catalog is deleted from future revisions of the catalog delivery, its number will be retired. When new sources are added, they will be assigned unique numbers starting with 4045.

2.2.4 Angular Positions (*characters 29 through 65*)

Angular positions are specified by a pair of angular coordinates: RA and DEC. Note that while right ascension used to be defined as the angular distance along the celestial equator from the intersection of the equator and the ecliptic, this is no longer true once one becomes concerned with accuracy levels < 100 milliarcseconds (500 nrad).

Since 1 January 1998, right ascension, and most importantly the origin of RA, have been defined by conventional agreement as to the value of the RA of extragalactic radio sources. In practice this means that the axes implicitly defined by a set of source positions must agree with the ICRF2 [8] to within the formal uncertainty of the ICRF2 axes or approximately 10 μ as (1

standard deviation). Thus, the orientation of the celestial frame axes may vary in future realizations by roughly that amount.

2.2.4.1 Right Ascension (*characters 29 through 47*)

Right ascension is presented in the form “*hh mm SS.ssssssss*” where the first sub field gives hours of RA followed by (time) minutes of RA and (time) seconds of RA to eight decimal places.

2.2.4.2 Declination (*characters 49 through 65*)

Declination is presented in the form “*Sdd mm SS.ssssssss*” where first sub-field, S or column 49, gives the sign of declination (a blank is allowed and should be interpreted as a positive declination). The remaining subfields give angular declination in degrees, minutes, and seconds to seven decimal places.

Note that a minus sign applies to the whole declination (*dd mm SS.ssssssss*). For example, a declination of $-00\ 00\ 00.\text{sssssss}$ should be read as minus 0. sssssss arcseconds of declination. This means that users desiring decimal representations of declination must first convert from degrees, minutes, seconds format to decimal format before applying the relevant sign. To simplify this conversion, the sign is in a fixed position in the fixed-width file.

2.2.5 Right Ascension Error (*characters 66 through 76*)

This field provides the formal one standard deviation right ascension uncertainty in units of seconds of time.

2.2.6 Declination Error (*characters 77 through 86*)

This field provides the formal one standard deviation declination uncertainty in units of arcseconds of angle.

2.2.7 Correlation of Right Ascension and Declination (*characters 87 through 94*)

This field provides the formal correlation of right ascension and declination. The quantity may range from -1.0 to $+1.0$ and a blank in front of the value should be interpreted as indicating a positive correlation. Values near zero indicate that the principal axes of the error ellipse are close to the RA-Dec axes. The large number of negative correlations is, in part, due to the large influence of the California to Australia baseline (typically between DSS-15 and DSS-45) on determination of declination.

2.2.8 Observation Epochs (*characters 95 through 110*)

Epochs are referred to Modified Julian Day (MJD) and are typically on the order of 50000 days.

2.2.8.1 Initial (*characters 95 through 102*)

The earliest epoch of the first observation.

2.2.8.2 Last (*characters 103 through 110*)

The termination epoch of the most recent observation.

2.2.9 Number of Sessions (*characters 111 through 116*)

The number of sessions, where a session is defined as a continuous data collection period, may be used as a rough indicator of the robustness of the position determination. Any position based on less than 3 sessions should be considered provisional.

2.2.10 Correlated Flux Density (*characters 117 through 128*)

This is an estimate of the average correlated flux density for observations of the radio source using DSN baselines Goldstone–Madrid and Goldstone–Canberra. Average correlated flux density values are reported for each baseline when available. This value, in Janskys (Jy), is computed from the measured signal-to-noise ratio (SNR) using the formula:

$$S(\text{Jy}) \approx \frac{\text{SNR}}{150}$$

The SNR is determined during the cross-correlation and fringe-fitting of actual radio source observations. If no recent observations of a radio source on DSN baselines are available, no value is provided for correlated flux. Independent values for the correlated flux density are reported for the California–Madrid and the California–Canberra DSN baselines.

2.2.10.1 Correlated Flux Density Madrid Baseline (*characters 117 through 122*)

This is the correlated flux density for quasars observed on the Goldstone-Madrid (10-60) baseline. Flux densities on this baseline are available for 643 of the sources in Table 1.

2.2.10.2 Correlated Flux Density Canberra Baseline (*characters 123 through 128*)

This is the correlated flux density for quasars observed using the Goldstone-Canberra (10-40) baseline. Flux densities on this baseline are available for 608 of the sources in Table 1.

2.2.11 Structure Index (*characters 129 through 133*)

The structure index is determined through the following relationship between the radio source structure index and the median value of the VLBI structure delay corrections [8]:

$$\text{SI} = 1 + 2 \log(\tau_{\text{median}})$$

where SI is the structure index, and τ_{median} is the median value of the structure delay corrections(ps). A value for τ_{median} in the range of 0 to 40 ps is typical for a source that is point-like. A value in the range of 40 to 60 ps is typical for a source that has significant structure. The source structure itself may contribute an error of this magnitude to the delay error budget. Values of the delay scatter greater than 60 ps are typical for sources with large, extended, and possibly variable structure. Estimates of the structure index are available for 693 of the sources in Table 1.

Table 1. X-Band Radio Source Catalog: DDOR_2011

| Source Name | | ID No. | Right Ascension | | | Declination | | | RA Error (s) | Dec. Error (arcsec) | RA-Dec Corr. | Observation Epoch MJD | | No. Session | Source Flux (Jy) | | Str. Index |

4 *Acknowledgements*

Production of the radio source catalog requires the efforts and cooperation of a large number of people. This includes the support staffs at the DSN and the antennas of the International VLBI Service [10] who ensure that the data are collected, the correlation and fringe fitting staffs, and the analysts who have developed the models and software to convert the delay and delay rate observations to produce final estimates of the source positions, and finally the authors of this document. Among these we would like to particularly acknowledge JPL employees Christine Chang, Michael Heflin, Christopher Jacobs, Peter Kroger, Gabor Lanyi, Ojars Sovers, and Alan Steppe.
